Developing Biomedical Ontologies using Protégé
(ICF Ontology and Protégé workshop 2008)

Nigam Shah
Stanford University
nigam@stanford.edu

Based on a four hour tutorial @ ISMB 2008
“How to make useful ontologies for biomedicine”
Overview of OWL

Nigam Shah
nigam@stanford.edu

OWL

- Web Ontology Language
- Recommended by W3C since Feb 2004
- Based on predecessors (DAML+OIL)
- A Web Language: Based on RDF(S)
- An Ontology Language: Based on logic
- Three varieties
  - OWL-full
  - OWL-DL (“OWL”)
  - OWL-Lite
The Three Sublanguages of OWL

OWL Full
Maximum expressiveness with syntactic freedom of RDF with no computational guarantees

OWL DL
Highly expressive while retaining computational completeness

OWL Lite
Classification hierarchy and simple constraints

OWL constructs

<table>
<thead>
<tr>
<th>Construct</th>
<th>OWL Full</th>
<th>OWL DL</th>
<th>OWL Lite</th>
</tr>
</thead>
<tbody>

<tr>
<td>Semantics</td>
<td>Semantics</td>
<td>Semantics</td>
<td>Semantics</td>
</tr>
</tbody>
</table>

OWL constructs include:
- Axioms
- DataTypes
- Key
- Language
- Syntax
- Semantics

OWL Full offers maximum expressiveness with syntactic freedom of RDF with no computational guarantees. OWL DL provides highly expressive semantics while retaining computational completeness. OWL Lite offers maximum expressiveness with syntactic freedom of RDF but with no computational guarantees.
Working with OWL syntax is not easy

Tools are being developed for OWL

Even with nice XML tools, RDF syntax is not very nice to work with
Open world vs. Closed world

- Open world: A statement can be true unless explicitly known to be false.
  - What is not known/stated *can* be true.

- Closed world: A statement is false unless explicitly known to be true.
  - What is not known is assumed to be false.

---

Basic Protégé-OWL usage

Nigam Shah
nigam@stanford.edu
Protégé OWL: a GUI environment

- OWL environment within PROTÉGÉ framework
- Most widely used tool for editing and managing OWL ontologies
- Approx 107,000 registered users

Protégé OWL features

- Loading and saving OWL files & databases
- Graphical editors for class expressions
- Access to description logics (DL) reasoners via Protégé GUI and the DIG interface
- Ontology visualization plug-ins
- Built on Protégé platform
  - Can hook in custom-tailored components
  - Can serve as API for new applications (including web applications)
PROJECTS

Loading OWL files

1. **If you only have an OWL file:**
   - *File ➔ New Project*
   - *Select OWL Files as the type*
   - *Tick Create from existing sources*
   - *Next to select the .owl file*

2. **If you’ve got a valid project file***:
   - *File ➔ Open Project*
   - *select the .pprj file*

* ie one created on this version of Protégé - the s/w gets updated once every few days, so don’t count on it unless you’ve created it recently– safest to build from the .owl file if in doubt
(Create or load an OWL project)

File ➔ New Project
OR
File ➔ Open Project

Protégé OWL Overview

- **Classes**
  - Subclass relationships
  - Disjoint classes

- **Properties**
  - Characteristics (transitive, inverse)
  - Range and Domain
    - ObjectProperties (references)
    - DatatypeProperties (simple values)

- **Individuals**
  - Property values

- **Class Descriptions**
  - Restrictions
  - Logical expressions

OWL for data exchange
OWL for classification and reasoning
 Ontology Development Process

In reality - an iterative process:

Establish Purpose

What will the ontology be used for?

Classification of Pneumonia:

- Bacterial Pneumonia (caused by bacteria)
- Pneumococcal Pneumonia (caused by a particular kind of bacteria)
- Viral Pneumonia (caused by viruses)
- Mixed Pneumonia (caused by both bacteria and viruses)
Enumerate Important Entities

- What are the entities we need to talk about? *Pneumonias, infectious organisms.*
- What are the properties of these entities? `hasRadiologyFinding, hasLocus, hasCause`.
- What do we want to say about the entities? *Pneumonias cause radiology opacity findings*  
  *Pneumonias are located in lung*  
  *Mixed pneumonias are caused by bacteria and viruses.*  
  ...

CLASSES (Types, Universals)
Classes

- Sets of **individuals** with common characteristics
- **Individuals** are *instances* of at least one class

Superclass Relationship

- Classes organized in a hierarchy implies subsumption
- Direct instances of subclass are also (indirect) instances of superclasses
**Class overlap**

- Classes can overlap arbitrarily
- Classes are assumed non-disjoint by default (ie, they may share instances)

```
City
  \[\bigcap\]
  Cairns
  Sydney
  BondiBeach
  RetireeDestination
```

**Class Disjointness**

- All classes could potentially overlap
- Specify **disjointness** to make sure they don’t share instances

```
City
  \[\bigcap\]
  Sydney
  Woomera
  CapeYork
  RuralArea
  UrbanArea
  Destination

Sydney disjointWith RuralArea
```
Class Editor

- Class annotations (for class metadata)
- Class name and documentation
- Properties “available” to Class
- Disjoints widget
- Conditions Widget
- Class-specific tools (find usage etc)

Define classes and the class hierarchy

- Identify Classes (from the previous entity list)
  - If something can have a kind then it is a Class
  - “Kind of Pneumonia” ∨ - Pneumonia is a Class
  - “Kind of Samson” ⊆ - Samson is an individual
  - “Kind of Bacteria” ∨ Bacteria is a Class
Define classes and the class hierarchy

- Arrange Classes in an hierarchy
  - PneumococcalPneumonia is a subclass of Pneumonia
    - Every PneumococcalPneumonia is a Pneumonia
  - Pneumococcus is a subclass of Bacteria
    - Every Pneumococcus is a Bacteria
  - MixedPneumonia is a subclass of Pneumonia
    - Every MixedPneumonia is a Pneumonia

Create classes: “Pneumonia” class
Class Disjoists

Note that Bacterial Pneumonia
- has superclass Pneumonia as a necessary condition
- Is asserted to be disjoint from its ‘siblings’

What it means

- All BacterialPneumonias are Pneumonias
  - No BacterialPneumonia is not a Pneumonia
- Nothing is both:
  - a BacterialPneumonia and a ViralPneumona
  - a BacterialPneumonia and a MixedPneumonia

NB: In OWL classes can overlap unless declared disjoint!
Add metadata on Classes

Another Way to Create Classes

- A class can be the **union** of two classes
  - An InfectiousPneumonia is either a BacterialPneumonia or a ViralPneumonia
- A class can be the **intersection** of two classes
  - A MixedPneumonia is any Pneumonia that is caused by both Bacteria and Viruses
- A class can be the **complement** of another class
  - Noninfectious pneumonia is any pneumonia that is not caused by an infectious agent (bacteria or virus)
Create a class by composition

An InfectiousPneumonia is a Pneumonia that is either a BacterialPneumonia or a ViralPneumonia
OWL Properties

- **Datatype Property** – relates Individuals to data (int, string, float etc)
  - Pneumonia hasRadiologyFinding xsd:String

- **Object Property** – relates Individuals
  - BacterialPneumonia hasCause Bacterium

- **Annotation Property** – for attaching metadata to classes, individuals or properties
  - OntologyClass hasAuthor Natasha

Datatype Properties

- Link individuals to primitive values (integers, floats, strings, booleans etc)
- Often: AnnotationProperties without formal “meaning”

<table>
<thead>
<tr>
<th>Sydney</th>
</tr>
</thead>
<tbody>
<tr>
<td>hasSize = 4,500,000</td>
</tr>
<tr>
<td>isCapital = true</td>
</tr>
<tr>
<td>rdfs:comment = “Don't miss the opera house”</td>
</tr>
</tbody>
</table>
Object Properties

- Link two individuals together
- Relationships (0..n, n..m)

![Diagram of Sydney, hasPart BondiBeach, hasAccommodation Four Seasons]

Annotation Properties

- To annotate classes, properties, and individuals
- Usually used for documentation

![Diagram of Sydney, rdfs:comment My comment, hasAuthor Kaustubh Supekar]
### Mathematical properties of an OWL ‘property’

- **Functional**
  - Person has_Mother Mother

- **Transitive**
  - A hasPart B, B hasPart C ==> A hasPart C

- **InverseFunctional**
  - Person has_SSN SSN

- **Symmetric**
  - A worksWith B ==> B worksWith A

---

### Define Properties of Classes

- Properties in a class definition describe attributes of instances of the class and relations to other instances
  - Each Pneumonia will have radiology findings and a cause
  - Each cause for pneumonia will have a causative organism.
Create object property “has_part”

- Click on properties tab
- Click on Create_Object_property icon and create has_part

Object property hasLocus (already present)
Datatype Property “hasRadiologyFinding”

Datatype = string

Create annotation property “hasAuthor”
Restrictions (Overview)

- An **anonymous class** consisting of all individuals that fulfill the condition
- Define a condition for property values
  - allValuesFrom
  - someValuesFrom
  - hasValue
  - minCardinality
  - maxCardinality
  - cardinality
Define Constraints: OWL Restrictions

- **Quantifier** restriction
  - How to represent the fact that every pneumonia must be located in a lung?

- **Cardinality** restrictions
  - How to represent that a lung must have 3 lobes as parts?

- **hasValue** restrictions
  - How to define the value of a relation for a class? (relationship between class and an individual)

Creating Restrictions

![Creating Restrictions Diagram]
Create a restriction: using a datatype property

“All pneumonias are disorders that have a radiological finding of opacification”

Create a restriction: using an object property

“All pneumonias are disorders that are located in some lung and have a radiological finding of opacification”
... more object properties

- BacterialPneumonia is caused by some bacteria
  - BacterialPneumonia \in\text{causedBy} some Bacteria
  - BacterialPneumonia \rightarrow \exists \text{causedBy}.Bacteria

- ViralPneumonia is caused by some virus
  - ViralPneumonia \in\text{causedBy} some Virus

- MixedPneumonia is caused by some bacteria and by some virus
  - MixedPneumonia \in (\text{causedBy} some Bacteria) \cap (\text{causedBy} some Virus)

CLASS EXPRESSIONS
"All MixedPneumonias are Pneumonias caused by Bacteria and by Viruses"

Class Descriptions

- Define the “meaning” of classes
- Description Logic expressions (“anonymous class expressions”) are used:
  - “All national parks have campgrounds.”
  - “A backpackers destination is a destination that has budget accommodation and offers sports or adventure activities.”
- Expressions restrict property values
- Reasoners can perform inference/classification
Defined/Primitive Classes

**Necessary Conditions:**
(Primitive / partial classes)
“If we know that something is a X, then it must fulfill the conditions...”

**Necessary & Sufficient Conditions:**
(Defined / complete classes)
“If something fulfills the conditions..., then it is an X.”

---

**NationalPark**

- Necessary Conditions:
  - Describes a subclass
    “If something is a Class_X, then it must fulfill the conditions...”
    *Converse may NOT be true: “If something fulfills the conditions..., then it is a Class_X.”*

**QuietDestination**

- Necessary & Sufficient Conditions:
  - “If something fulfills the conditions..., then it is a Class_X.”
e.g., Disorder is a necessary condition on Pneumonia

"If something is a Pneumonia, then it is a Disorder"
BUT
"If something is a Disorder, it may not be a Pneumonia"

Necessary & sufficient conditions on BacterialPneumonia

"If N&S conditions, then it is a BacterialPneumonia"
AND
"If something is a BacterialPneumonia, then N&S conditions"
INDIVIDUALS

- Represent specific things in the domain
- Two names could represent the same “real-world” individual

Sydney

Bondi Beach

Syneys Olympic Beach
Create OWL instances

Create an instance of a class
• The class becomes a direct type of the instance
• Any superclass of the direct type is a type of the instance
• Generally, you create instances if you have a “type-of” something

Classification
## Reasoners

- Reasoners ("classifiers") infer information that is not explicitly contained within the ontology
- Standard reasoner services are:
  - **Consistency Checking** (i.e., satisfiability—can a class have any instances?)
  - **Subsumption Checking** (Finding subclasses—is $A$ a subclass of $B$?)
  - **Equivalence Checking**
  - **Instantiation Checking** (Which classes does an individual belong to)
- For Protégé Pellet in pre-configured (but other tools with DIG support work too)
- Reasoners can be used at runtime in applications as a querying mechanism
- Used during development as an ontology "compiler". Ontologies can be compiled to check if the meaning is what was intended

## Run a DL Reasoner with Protégé

### OWL

- Protégé OWL can work with multiple reasoners
  - Racer (http://www.racer-systems.com/)
  - Pellet (http://www.mindswap.org/2003/pellet/)
  - Fact++ (http://owl.man.ac.uk/factplusplus/)
- Need to install, configure, and run at least one reasoner
  - Pellet comes pre-configured
- Protégé OWL and reasoner exchange information through inter-process communication
Common Mistakes

Common errors

- **Lack of disjointness axioms causes what looks like "obvious misclassification"**
  - Open world assumption: classes can overlap unless you explicitly say they don’t.

- **Lack of a closure axiom causes misclassification**

- **Trivial satisfaction of constraints (e.g. a missing existential 'some' declaration) can lead to weird classification**
  - e.g. an infection caused only by (herpes virus and HIV virus) will get classified as a bacterial infection!
  - ... because, the (herpes virus and HIV virus) is a null-set and the null-set is a subset of the 'bacteria' (which are disjoint with viruses) and hence the "an infection caused only by (herpes virus and HIV virus)" will be called a bacterial infection!
  - ONLY does not mean SOME

Visualizing our OWL example

Asserted Ontology

Inferred Ontology
Limitations

What OWL can not do

- **OWL is a subset of first order logic with two variables**
  - “Binary relational”
    - n-ary relations require “reifying” the relation
      - i.e. re-representing the relation as a class
    - See n-ary relations note at W3C
  - n-ary predicates can always be represented as binary predicates
    - subject to other limitations of OWL

- **No representation for “same”**
  - The Owner is the same as the Person responsible

- **No representation for “All-All” statements**
  - “All licensed drivers are authorized to drive all cars”
  - Known to be tractable but no implementation available
What OWL can not do

- **Representation of “optional” properties is not standardized.**
  Options:
  - Min cardinality 0
  - Member of the domain

- **No representation of uncertainty**

- **No representation of defaults and exceptions**

- **No higher order predicates**
  - OWL-DL is strictly first order
    - Can’t say … “Members of endangered species”

- **No closed world reasoning**
  - Everything must be closed explicitly
    - Take care when transforming from databases!

Summary
What does all this mean?

• Description logic (and OWL-DL) provides
  • Expressivity with semantic precision
  • Compositional definitions:
    • define new classes from old
    • Automatic classification & consistency checking

• Protégé OWL provides a GUI for developing OWL ontologies

• Be careful with
  • Open world reasoning
    • Use closure axioms when needed
  • “some” and “only” – someValuesFrom/allValuesFrom
  • domain and range constraints
  • making disjoint explicit
